Numerical Methods for Conservation Laws

Randall J. LeVeque, R. Leveque

Numerical Methods for Conservation Laws Randall J. LeVeque, R. Leveque
These notes developed from a course on the numerical solution of conservation laws first taught at the University of Washington in the fall of 1988 and then at ETH during the following spring. The overall emphasis is on studying the mathematical tools that are essential in de veloping, analyzing, and successfully using numerical methods for nonlinear systems of conservation laws, particularly for problems involving shock waves. A reasonable un derstanding of the mathematical structure of these equations and their solutions is first required, and Part I of these notes deals with this theory. Part II deals more directly with numerical methods, again with the emphasis on general tools that are of broad use. I have stressed the underlying ideas used in various classes of methods rather than present ing the most sophisticated methods in great detail. My aim was to provide a sufficient background that students could then approach the current research literature with the necessary tools and understanding. Without the wonders of TeX and LaTeX, these notes would never have been put together. The professional-looking results perhaps obscure the fact that these are indeed lecture notes. Some sections have been reworked several times by now, but others are still preliminary. I can only hope that the errors are. not too blatant. Moreover, the breadth and depth of coverage was limited by the length of these courses, and some parts are rather sketchy.

From reader reviews:

John Alfaro:

Book is definitely written, printed, or outlined for everything. You can know everything you want by a e-book. Book has a different type. As we know that book is important thing to bring us around the world. Next to that you can your reading proficiency was fluently. A publication Numerical Methods for Conservation Laws will make you to end up being smarter. You can feel more confidence if you can know about anything. But some of you think in which open or reading a book make you bored. It is not necessarily make you fun. Why they are often thought like that? Have you seeking best book or ideal book with you?

Gary McIntosh:

Book is to be different per grade. Book for children right up until adult are different content. We all know that that book is very important usually. The book Numerical Methods for Conservation Laws ended up being making you to know about other understanding and of course you can take more information. It is rather advantages for you. The book Numerical Methods for Conservation Laws is not only giving you more new information but also to get your friend when you truly feel bored. You can spend your own spend time to read your reserve. Try to make relationship with the book Numerical Methods for Conservation Laws. You never sense lose out for everything when you read some books.

James Mendoza:

Are you kind of stressful person, only have 10 or even 15 minute in your day to upgrading your mind proficiency or thinking skill actually analytical thinking? Then you are receiving problem with the book than can satisfy your limited time to read it because pretty much everything time you only find reserve that need more time to be go through. Numerical Methods for Conservation Laws can be your answer since it can be read by you actually who have those short free time problems.

Ella Hodge:

As a university student exactly feel bored to be able to reading. If their teacher expected them to go to the library in order to make summary for some guide, they are complained. Just little students that has reading's internal or real their passion. They just do what the professor want, like asked to go to the library. They go to presently there but nothing reading very seriously. Any students feel that studying is not important, boring along with can't see colorful photographs on there. Yeah, it is to be complicated. Book is very important for you. As we know that on this era, many ways to get whatever you want. Likewise word says, many ways to reach Chinese's country. Therefore this Numerical Methods for Conservation Laws can make you experience more interested to read.
